Respond to appellant's points

Appellant's point

The medical evidence was not considered

Tin cry is the characteristic sound heard when a bar made of tin is bent. Variouslly described as a "screaming" or "crackling" sound, the effect is caused by the crystal twinning in the metal.[1] The sound is not particularly loud, despite terms like "crying" and "screaming". It is very noticeable when a hot-dip tin coated sheet metal is bent at high speed over rollers during processing.
